1. Most patients will require at least two visits for care during the first decade of use.
   a. True
   b. False

2. The most common material used for implant supported fixed detachable prosthesis (hybrid denture), is a titanium bar with a layering of acrylic resin and denture teeth.
   a. True
   b. False

3. For this type of prosthesis to be strong, a minimum of 13mm of restorative space per arch is required.
   a. True
   b. False

4. Some of the effects of having zirconia opposing acrylic teeth include wear, breakage and de-bonding. The most common one being breakage.
   a. True
   b. False

5. Prior to beginning a case, where dissimilar materials will be utilized, the patient should be informed of the possible complications including wear of the acrylic prosthesis, which will require repair, including likely a change of teeth.
   a. True
   b. False

6. Ideally, the clinician that has planned and executed the case should keep the articulated casts with the established vertical dimension, to make repair easier for the technician.
   a. True
   b. False

7. The average time it will take the technician to do this procedure from the time he receives the worn prosthesis to the moment he processes the new restoration is about 2 hours.
   a. True
   b. False

8. The average time it will take the clinician is three appointments that last approximately 45 minutes each.
   a. True
   b. False

9. In a clinical practice that has an in-house laboratory this could potentially mean the patient could be appointed early in the morning and have a fully restored restoration the same afternoon.
   a. True
   b. False

10. The practice that works with dental implant patients should have contingency plans for these patients as well as preventive measures.
    a. True
    b. False
